

mod_perl

DEVELOPER'S COOKBOOK

mod_perl is a unique piece of software that wholly integrates the power of Perl with the flexibility and stability of the Apache Web server. With mod_perl, developers can harness the power of the full Apache API and develop Web applications quickly and without sacrificing performance.

The *mod_perl Developer's Cookbook* teaches programming with the mod_perl API by example. The book takes developers from the basics of mod_perl to the development of advanced Web applications. Developers will learn tricks, solutions, and mod_perl idioms gleaned from the authors' experience as developers and expert users of mod_perl.

Geoffrey Young is a frequent contributor to the mod_perl community and has written scores of mod_perl handlers, the most useful of which can be found on CPAN.

Paul Lindner manages, designs, and implements mod_perl applications at Critical Path. He is a long-time Internet and open-source developer, and was one of the founders of the Internet Gopher at the University of Minnesota.

Randy Kobes is a professor of physics at the University of Winnipeg who conducts research on chaos and fractals. He used mod_perl to establish a search engine for CPAN.

“Developers searching for solutions to specific problems can use this book as a collection of ready-made recipes to be understood and applied to their problems. Developers searching for continuing mod_perl education will find the recipes contained herein to be enlightening, well-researched, and broadly applicable.”
