

Writing Tests with Apache::Test

Part II

Geoffrey Young

`geoff@modperlcookbook.org`

Apache - Test

- Framework for testing Apache-based application components
- Part of the mod_perl ASF project
- Provides tools to make testing Apache related things simple
- Written in Perl
- Familiar interface
 - `Test.pm`, `Test::More`, `LWP`, etc

Last Year...

- I introduced Apache-Test mechanics
- Everyone was impressed
- Some people even started using it
- There's so much I didn't tell you
- But first, let's review...

Testing, Testing... 1, 2, 3

1. Perl Makefile.PL **foo**
2. Apache httpd.conf **foo**
3. Write the tests

Step 1 - Makefile.PL

```
use Apache::TestMM qw(test clean);
use Apache::TestRunPerl ();

# configure tests based on incoming arguments
Apache::TestMM::filter_args();

# generate the test harness (t/TEST)
Apache::TestRunPerl->generate_script();
```

Step 2 – Apache Foo

- Apache needs a basic configuration to service requests
 - ServerRoot
 - DocumentRoot
 - ErrorLog
 - Listen
- Apache-Test "intuits" these and creates its own httpd.conf
- You augment this with extra.conf.in

t/conf/extra.conf.in

```
Alias /basic @DocumentRoot@
```

```
<Location /basic>
    Require valid-user
    AuthType Basic
    AuthName myrealm
```

```
    PerlAuthenHandler Apache::BasicAuth
</Location>
```

BasicAuth.pm

```
package My::AuthenHandler;

use Apache2::Const -compile => qw(OK HTTP_UNAUTHORIZED);

use Apache2::RequestRec ();
use Apache2::Access ();

sub handler {

    my $r = shift;

    # Get the client-supplied credentials.
    my ($status, $password) = $r->get_basic_auth_pw;

    return $status unless $status == Apache2::Const::OK;

    # Perform some custom user/password validation.
    return Apache2::Const::OK if $r->user eq $password;

    # Whoops, bad credentials.
    $r->note_basic_auth_failure;
    return Apache2::Const::HTTP_UNAUTHORIZED;
}

1;
```

Step 3 – The Tests

- Standard Perl foo

```
plan tests => 3;
```

```
ok ($condition);
```

```
etc...
```

t/01basic.t

```
{  
    my $response = GET '/basic/index.html';  
  
    is ($response->code,  
        401,  
        "no valid password entry");  
}  
  
{  
    my $response = GET '/basic/index.html',  
                    username => 'geoff',  
                    password => 'geoff';  
  
    is ($response->code,  
        200,  
        "geoff:geoff allowed to proceed");  
}
```

Testing, Testing... 1, 2, 3

1. Generate the test harness
2. Configure Apache
3. Write the tests
4. Run the tests

Client-Side Tests

- The test file acts as a web browser
- The client is scripted to
 - query the server
 - compare server response to expected results
 - indicate success or failure
- In short, the granularity rests in the client
 - that's where all the calls to `ok()` are

Server-Side Tests

- Apache::Test provides a mechanism for achieving granularity in the Apache runtime
- Highly magical (not really)
- Let's see it in action...

Apache::SSLLookup

- mod_ssl exposes a few optional functions in C
 - is_https # true if https://
 - ssl_var_lookup # SSL_CLIENT_VERIFY
- Apache::SSLLookup provides Perl glue
 - Apache::SSLLookup->new()
 - is_https()
 - ssl_lookup()

What to Test?

- Class
 - compiles
- Constructor
 - defined
 - returns an object of the proper class
 - returns an object with proper attributes
- Methods
 - defined
 - do something useful

Where To Test

- Clearly this API needs a real Apache + mod_perl runtime

```
$ perl -MApache::SSLLookup -e0
```

```
Can't load 'Apache/SSLLookup/SSLLookup.so'
for module Apache::SSLLookup:  undefined
symbol: MP_debug_level
```

- Apache-Test++
- But even here we have choices

Options

- Client-side test
 - do a bunch of stuff on the server and simply return
 - OK if it went OK
 - 500 if it didn't
 - testing in aggregate
- Server-side test
 - much more granular
 - each test can individually pass or fail
- It's all about where you call `ok()`

```
package TestSSL::01new;

use Apache::Test qw(-withtestmore);

use Apache::Const -compile => qw(OK);

sub handler {

    my $r = shift;

    plan $r, tests => 2;

    {

        use_ok('Apache::SSLLookup');

    }

    {

        can_ok('Apache::SSLLookup', 'new');

    }

    return Apache2::Const::OK
}

1;
```

Magic

- Magical things happen if you follow a specific filesystem pattern
- In our case

t/response/TestSSL/02new.pm

automagically generates

t/ssl/02new.t

and an entry in

t/conf/httpd.conf

t/ssl/02new.t

```
# WARNING: this file is generated, do not edit

```

```
use Apache::TestRequest 'GET_BODY_ASSERT';
print GET_BODY_ASSERT "/TestSSL__02new";
```

t/conf/httpd.conf

```
<Location /TestSSL__02new>
    SetHandler modperl
    PerlResponseHandler TestSSL::02new
</Location>
```

t/conf/httpd.conf

```
<Location /TestSSL__02new>
    SetHandler modperl
    PerlResponseHandler TestSSL::02new
</Location>
```

```
sub handler {  
  
    plan shift, tests => 7;  
  
    use_ok('Apache::SSLLookup');  
  
    can_ok('Apache::SSLLookup', 'new');  
  
    eval { my $r = Apache::SSLLookup->new() };  
  
    like ($@, qr/Usage:/, 'new() requires arguments');  
  
    eval { my $r = Apache::SSLLookup->new({}) };  
  
    like ($@, qr/invoked by a 'unknown' object with no 'r' key/,  
          'new() requires an object');  
  
    eval { my $r = Apache::SSLLookup->new(bless {}, 'foo') };  
  
    like ($@, qr/invoked by a 'foo' object with no 'r' key/,  
          'new() requires an Apache2::RequestRec object');  
  
    my $r = Apache::SSLLookup->new($r);  
  
    isa_ok($r, 'Apache::SSLLookup');  
    isa_ok($r, 'Apache2::RequestRec');  
  
    return Apache2::Const::OK;  
}  
http://www.modperlcookbook.org/~geoff/
```

```
sub handler {  
  
    plan shift, tests => 7;  
  
    use_ok('Apache::SSLLookup');  
  
    can_ok('Apache::SSLLookup', 'new');  
  
    eval { my $r = Apache::SSLLookup->new() };  
  
    like ($@, qr/Usage:/, 'new() requires arguments');  
  
    eval { my $r = Apache::SSLLookup->new({}) };  
  
    like ($@, qr/invoked by a 'unknown' object with no 'r' key/,  
          'new() requires an object');  
  
    eval { my $r = Apache::SSLLookup->new(bless {}, 'foo') };  
  
    like ($@, qr/invoked by a 'foo' object with no 'r' key/,  
          'new() requires an Apache2::RequestRec object');  
  
    my $r = Apache::SSLLookup->new($r);  
  
    isa_ok($r, 'Apache::SSLLookup');  
    isa_ok($r, 'Apache2::RequestRec');  
  
    return Apache2::Const::OK;  
}  
http://www.modperlcookbook.org/~geoff/
```

```
sub handler {
    my $r = shift;
    plan $r, tests => 3;
    {
        use_ok('Apache::SSLLookup');
    }
    {
        can_ok('Apache::SSLLookup', 'is_https');
    }
    {
        $r = Apache::SSLLookup->new($r);
        ok(defined $r->is_https,
           'is https returned a defined value');
    }
    return Apache2::Const::OK;
}
```

More Magic

- Take this code

```
package My::NeedsToBePreLoaded;

BEGIN {
    Apache->push_handlers(
        PerlChildInitHandler => sub { ... }
    );
}
```

- We need PerlModule or the PerlChildInitHandler won't run
–or startup.pl, of course

The Solution

```
package TestMy::NeedsToBePreloaded::01compile;

use Apache::Test qw(-withtestmore);

sub handler {

    plan shift, tests => 1;

    use_ok (My::NeedsToBePreloaded) ;

    return 0;
}

1;

__DATA__
# make sure that the PerlChildInitHandler
# invokes the BEGIN block
PerlModule My::NeedsToBePreloaded
```

t/conf/httpd.conf

```
# make sure that the PerlChildInitHandler  
# invokes the BEGIN block  
PerlModule My::NeedsToBePreloaded  
  
<Location /TestMy_NeedsToBePreloaded_01compile>  
    SetHandler perl-script  
    PerlHandler TestMy::NeedsToBePreloaded::01compile  
</Location>
```

DATA

- Stuff Apache foo into DATA
- Apache-Test converts to httpd.conf
 - with substitutions, like @DocumentRoot@
- Localized to generated <Location>
 - PerlModule, Alias, etc are special
- Use <Base></Base> to force top-level configuration

EOP

- Apache-Test is an Equal Opportunity Platform
- You can now use Apache-Test to test PHP too!
 - server-side
 - client-side

t/response/TestAPI/01php.php

```
<?php

include 'test-more.php';
